ANZCOR Guideline 9.2.2 – Stroke

Guideline

Who does this guideline apply to?
This guideline applies to adult and child victims.

Who is the audience for this guideline?
This guideline is for use by bystanders, first aiders and first aid providers.

1 Introduction

Stroke (previously known as cerebrovascular accident) is the second most common cause of death after heart disease.\(^1\,2\,3\,4\,5\). A stroke occurs when the supply of blood to part of the brain is suddenly disrupted or when spontaneous bleeding from a blood vessel within the skull occurs. Approximately 80% of strokes are caused by an acute blockage of a blood vessel supplying part of the brain. Stroke is a medical emergency.

When stroke is caused by an interruption to the blood supply to a part of the brain, that area of the brain is damaged and may die. The surrounding brain tissue is also affected and is at risk of dying. However, if the blockage can be rapidly cleared and blood supply restored, the amount of damage to brain tissue can be significantly reduced. Rapid recognition, protection and support of the airway, breathing and circulation, and rapid access to definitive stroke care can all contribute to reducing deaths and long term damage from stroke.\(^2\,3\)

2 Recognition

A sudden blockage of blood flow to an area of the brain, or bleeding, will produce symptoms of stroke. Symptoms may seem to improve but should still be considered as a stroke.

First aid providers can use stroke assessment systems such as FAST for individuals with suspected acute stroke (CoSTR 2015, strong recommendation, low quality evidence).\(^6\). FAST is a simple way for remembering the signs of stroke.\(^2\,3\,6\,7\)

- Facial weakness - can the person smile? Has their mouth or eye drooped?
- Arm weakness - can the person raise both arms?
- Speech difficulty - can the person speak clearly and understand what you say?
- Time to act fast – seek medical attention immediately – Call for an ambulance.
Other common symptoms of strokes include:

- numbness of the face, arm or leg on either or both sides of the body
- difficulty swallowing
- dizziness, loss of balance or an unexplained fall
- loss of vision, sudden blurred or decreased vision in one or both eyes
- headache, usually severe and of abrupt onset or unexplained change in the pattern of headaches
- drowsiness
- confusion
- reduced level of consciousness.

Symptoms of stroke may also be caused by other conditions such as epilepsy, migraine or diabetes with low blood sugar. If trained to check a blood sugar level, this can improve the accuracy of stroke diagnosis when used in conjunction with a stroke assessment tool (CoSTR 2015: weak recommendation/low quality evidence).

When there is doubt over diagnosis, the victim should be managed as having a stroke until proven otherwise.

A victim with the symptoms of stroke should be transported by ambulance because paramedics can start the management of stroke and make sure the victim is taken to the most appropriate hospital for specialist stroke management. Paramedics can also notify the receiving hospital, reducing time to the start of treatment.

### 3 Management

- Call an ambulance for any victim who has shown signs of stroke, no matter how brief or if symptoms have resolved.
- Do not give anything to eat or drink.
- Administer oxygen if available and trained to do so (ANZCOR Guideline 10.4). If a pulse oximeter is available, oxygen should only be administered to victims with oxygen saturation < 94%.
- Provide reassurance.
- If the victim is unconscious but breathing lay victim on the side and ensure airway is clear (ANZCOR Guideline 3).
- If the victim is unresponsive and not breathing normally, commence resuscitation following the Basic Life Support Flowchart (ANZCOR Guideline 8).
